#### **Building Windows Images for Firefox CI**

How SRE at Mozilla builds Windows Images for use in the continuous integration of Mozilla Firefox

#### **Speaker Name**

Jonathan Moss
Site Reliability Engineer at Mozilla
Github: https://github.com/jwmoss

### Thank you to our sponsors!

#### **Problem Statements**

- How do we build windows machine images quickly?
- How do we ensure the windows machine images are tested before they're used in continuous integration?
- How do we manage secrets when building machine images in Azure or other clouds?
- How do we keep costs low?
- How do we document what's installed on machine images?
- How do we make it easy to contribute?

#### Packer

- Tool used to build images for multiple platforms from a single source configuration.
- Integrates with PowerShell.
- Build images in Azure, GCP, and AWS.

#### **Puppet**

- Open source configuration as code language written in ruby.
- Often deployed in a client/server environment.
- We use a "master-less" implementation.

#### Continuous Integration for Firefox at Mozilla

Firefox's continuous integration (CI) system is made up of three parts.

First there's <u>Taskcluster</u>, a task execution framework developed by Mozilla. Taskcluster is capable of building complex, scalable and highly customizable CI systems. Taskcluster is more like a set of building blocks that can be used to create CI systems, rather than a fully-fledged CI system itself.

The second part is the <u>Firefox CI</u> instance of Taskcluster. This is the Taskcluster deployment responsible for running most of Mozilla's CI needs. This component is comprised of a Kubernetes cluster to run the Taskcluster services (maintained by SRE Services), some customizations to support Taskcluster on hg.mozilla.org and access control in the <u>ci-configuration</u> repo (maintained by Release Engineering).

The third part is <u>Taskgraph</u>. Taskgraph is a Python library that can generate a <u>DAG</u> of tasks and submit them to a Taskcluster instance. This is the component that most Gecko and Mozilla developers will interact with when working with tasks, and will be the focal point of the rest of this documentation.

Software used within Continuous Integration at Mozilla:

- Python
- PowerShell
- Golang
- HashiCorp Configuration Language (HCL)
- Javascript

# Let's look at some code!
